Inverses and Fermat's Little Theorem

Recall all are equivalent:

- $a \equiv b \pmod{m}$
- $m \mid (a - b)$
- $\exists k \in \mathbb{Z}, a - b = km$
- a and b have the same remainder when divided by m .
- $[a] = [b]$ in \mathbb{Z}_m

Multiplicative Inverse

Example: Find $[5]^{-1}$ in \mathbb{Z}_{17}

$$[5][x] = [1]$$

By inspection, $[x] = [7]$.

Therefore $[5]^{-1} = [7]$.

If we couldn't find a solution by inspection, we could convert into Linear Diophantine and solve.

$$5x + 17y = 1$$

Solve by EEA.

Linear Congruence Theorem 2

Let $\gcd(a, m) = d \neq 0$

The equation $[a][x] = [c]$ in \mathbb{Z}_m has a solution iff $d \mid c$. Also, if $[x] = [x_0]$ is one solution, the complete solution is $\{[x_0], [x_0 + 2\frac{m}{d}], \dots, [x_0 + (d-1)\frac{m}{d}]\}$

Prove:

i) $[a]^{-1}$ exists iff $\gcd(a, m) = 1$

As this is an 'if and only if', we must prove the implication both ways.

\implies :

Assume $[a]^{-1}$ exists.

$$\iff [a][x] = [1]$$

$$\iff \gcd(a, m) \mid 1 \text{ (By LCD 2)}$$

$$\iff \gcd(a, m) = 1$$

Because every property we used was an iff (That is, they all apply both ways), we can say WLOG, the other direction must be true as well.

$\therefore [a]^{-1}$ exists iff $\gcd(a, m) = 1$

ii) The multiplicative inverse pf $[a]$ in \mathbb{Z}_m is unique (if it exists)

if $[a]^{-1}$ exists in \mathbb{Z}_m , then

$[a][x] = [1]$ has a solution.

Thus, $\gcd(a, m) = 1$

By LCT2, the complete solution of all inverses is:

$$\{x_0, x_0 + m, x_0 + 2m, \dots\}$$

$$\equiv \{x_0\}$$

\therefore The inverse is unique.

Fermat's Little Theorem (FℓT)

If p is a prime number that does not divide an integer a , then
 $a^{p-1} \equiv 1 \pmod{p}$

Examples:

- i) $5^6 \equiv 1 \pmod{7}$
- ii) $3^6 \equiv 1 \pmod{7}$
- iii) $8^6 \equiv 1 \pmod{7}$
- iv) $35^6 \not\equiv 1 \pmod{7}$ (Because $7|35$)
- v) Find the remainder when 7^{32} is divided by 11.
By FℓT, $7^{10} \equiv 1 \pmod{11}$ (Since 11 is prime and $11 \nmid 7$)

$$\begin{aligned} 7^{32} &\equiv (7^{10})^9 7^2 \pmod{11} \\ &\equiv (1)^9 7^2 \pmod{11} \\ &\equiv 49 \pmod{11} \\ &\equiv 5 \pmod{11} \\ \therefore \text{ The remainder is } 5 \end{aligned}$$

FℓT in Congruence Classes

$$\begin{aligned} [a^{p-1}] &= [1] \text{ in } \mathbb{Z}_p \\ [a]^{p-1} &= [1] \text{ in } \mathbb{Z}_p \end{aligned}$$
